Internet Programming COSC 3351

Individual Project Proposal

## Overview

For this individual project for Internet Programming I am going to make a web app that is not just a showcase for the StomaWell product, but an assistant website to the product. The StomaWell Care Assistant is for people who have had a colostomy surgery and are now seeking the help of StomaWell. This app will allow the user to learn more about StomaWell, browse care instructions, have filters for tips and routines, and will show helpful steps.

StomaWell is a company that creates tables crafted specifically for those who have undergone a colostomy surgery, and have difficulties in their everyday life using a colostomy bag or are just looking to make their experience more comfortable. This product targets older audiences as it is harder for a senior to manage a colostomy surgery, but is available and useful for all ages!

## Data/Workflow

In this project I am going to use a local JSON file for the async feature that I will have as it is a specific product and application, not a general app that could use a public API for asynchronous data retrieval of a broad subject area. It will not be useful to grab medical assistance from a public medical API about a very specific issue that is not readily available in depth from one of these public API's. This app will feature a workflow that; As stated earlier, will allow the user to load the app, filter tips by category(Hygiene, safety, equipment), click a tip to expand details, and save tips to a "My care list".

In order to keep the scope of this project small, I am going to focus on keeping the website simple enough to where there is no need for fancy animations or many different articles or unneeded information, just focusing on making the web app exactly that, a web app. Making the page itself should not take very long, but making the specificities for the app will take longer, as the project is not a general medical issue, it is more specific as stated earlier. This project will only be one page, no links to other pages that include more information. It will only include one JSON file, have about 3-5 categories of tips, it will not have any backend or authentication, and a simple flexbox/grid layout that will not include any animations

Thank you for taking the time to read my proposal!
